A Regulatory Gap?
The Surge in Rail Transport of Crude Oil in Great Lakes States and Provinces

The Dramatic Surge in Crude Oil Transport By Rail is a Recent Phenomenon

On the Move
The amount of crude oil transported by rail, road and water skyrocketed in 2012.

Source: Energy Information Administration
The Wall Street Journal
More Transport Modes Are Being Used

Refinery receipts of crude oil by rail, truck, and barge
thousand barrels per day

- by rail
- by truck
- by barge, as % of total receipts

EIA
Rail is Being Used to Increase Capacity and Flexibility
This Is Not A Choice Between Pipelines And Rail

Shippers favor rail because it provides flexibility as shale plays change in profitability and to increase shipping capacity beyond that provided by pipelines.
Fourteen Derailment Incidents Occurred in North America in the Past Year
Infrastructural Risks

- The safety and reliability of the equipment
- The scale of the trains and effect on track condition
- Unsafe crossings
Contextual Risks

- Routing through highly populated areas – over 40 identified
- Disparate impacts – risks are borne by vulnerable populations in some cities
- Train routes proximate to critical waterways and environments
- Unclear best practice and financial accountability for accident follow-up
- Security risks
The US National Transportation Safety Board acknowledges that existing regulatory policy and capacity are not sufficient to address the risks to the public, property or the environment from the dramatic surge in rail transport of crude.

National-level pre-emption of railroads creates significant barriers to action and creates local costs and unfunded mandates.
What is “The State of Play”?

- Some local, state and provincial officials are insisting on a risk assessment and funds to pay for emergency preparedness.

- Some DOT 111 tank cars are being replaced by safer models.

- Government officials are becoming aware of significant governmental costs – public safety, monitoring, and emergency preparedness - as well as other public costs – wait times at urban crossings.
