RE: **Water Level Monitoring Data Summary for the Maumee River
Emergent Coastal/Floodplain Wetlands Restoration at Penn 7 Project;
COT303.0048**
Project Number: **COT303**

The purpose of this memorandum is to summarize the water level monitoring conducted at the completed emergent coastal/floodplain wetland habitat restoration project (Project) at Penn 7 located in Toledo, Ohio (Site). This water level monitoring was conducted as part of the National Oceanic and Atmospheric Administration's (NOAA's) Tier 1 Monitoring requirements and was completed to evaluate the Project's effectiveness at hydrologically reconnecting Penn 7 to the Maumee River.

Project Description

The Site includes Penn 7, which is a former confined disposal facility (CDF) for channel dredge material management along the Maumee River containing sediments dredged from the river, an open water embayment area, and an additional area of fill located north of the embayment adjacent to the CSX railroad bridge. Penn 7 previously occupied little value as a wetland due to the hydrologic isolation from the lower Maumee River so constructing a hydrologic connection between Penn 7 and the lower Maumee River restored emergent coastal/floodplain wetlands.

Water Level Monitoring

As described in the Quality Assurance Project Plan and Field Sampling and Analysis Addendum (QAPP Addendum) prepared by Hull & Associates, LLC (currently Verdantas LLC) and dated July 2020 (revised August 2020), water level monitoring was required as one part of NOAA's Tier 1 Monitoring to evaluate the project and determine if the project was implemented as designed and provides a basic level of effectiveness. During the first-year post-construction, this water level monitoring was to include monitoring water levels for a minimum 30-day monitoring period with two data loggers with pressure transducers recording water surface elevations at approximately 15-minute intervals during this period.

Water level monitoring was conducted from May 11, 2022 to June 13, 2022 with In-Situ Level TROLL 700 data loggers. During this monitoring period, the stop logs were removed from the water control structures (WCSs), except for the bottommost stop log, which is approximately 6 inches tall. The data loggers recorded water levels, pressure and temperature at approximately 5-minute intervals during this period. Data was downloaded approximately every week and the data loggers were inspected at this time. One was installed at the Channel WCS to record the water level from the interior of

Penn 7 and the other at the Embayment WCS to record the water level from the exterior of Penn 7/Maumee River (see Figure 1). The raw water level monitoring data is provided in Attachment A and photos of the WCSs and data loggers are provided in Attachment B.

Results

The water level, pressure and temperature monitoring data from the two data loggers was reduced down to 15-minute intervals and are presented on Figures 2, 3 and 4, respectively. In general, similar trends are observed between the Channel and Embayment WCSs, although the Embayment WCS recorded larger variations in the water level and pressure, at times, than the Channel WCS. In addition, the Embayment WCS water level was generally lower than the Channel WCS water level until around June 1, 2022.

The data logger water level readings were compared to water level measurements taken during site visits from the staff gauges installed in the WCSs to verify the readings. This comparison is presented in Table 1 and indicates that the data logger readings were generally in line with the staff gauge measurements during the monitoring period as evidenced by an elevation difference generally less than 0.1 feet.

The water level readings were also compared to those from the NOAA Tides and Currents Station ID 9063085 (NOAA Station) located near the mouth of the Maumee River at 41° 41.6 N and 83° 28.3 W as shown on Figure 5. Note that the NOAA Station only records water levels every hour so the data logger water level data was further condensed to match this interval. In addition, the NOAA Station readings were adjusted from the International Great Lakes Datum of 1985 (IGLD85) to North American Vertical Datum of 1988 (NAVD88) using a conversion of +0.208 feet as determined for the Site with the NOAA Online Vertical Datum Transformation tool. The water level readings between the NOAA Station and the Channel WCS appear to be in very close agreement throughout the monitoring period and the Embayment WCS generally follows similar trends (i.e., rise and fall).

Conclusions

While there are some variations with the Embayment WCS, the Channel WCS closely followed the NOAA Station readings. Since this WCS is located in the interior of the Site, it suggests that the Site overall follows the water levels in the Maumee River.

Differences in the Embayment WCS water levels compared to the Channel WCS and NOAA Station readings may be due to multiple reasons. One potential reason is due to the large size of the embayment, this area (and correspondingly the Embayment WCS) may have taken longer to reach an equilibrium with the Maumee River than the Channel WCS. While the Channel WCS should be influenced by the embayment water level, it is also affected by the water level in the wetland, which may have equilibrated with the Maumee River more quickly than the embayment. In addition, since the data logger was located within the WCS, water levels may have changed more drastically in this structure

than in the embayment itself. This was likely not an issue with the Channel WCS as it was located in the interior of the Site and the changing water levels would have been moderated by flow through the Embayment and Wetland WCSs. Lastly, the water level within the Embayment WCS may also have been influenced by the wake from boats on the Maumee River and outflow from storm pipes located within the Site.

Overall, the water level monitoring data indicates that the project was successful at hydrologically reconnecting Penn 7 to the Maumee River.
